# DM74LS259 8-Bit Addressable Latches

#### **General Description**

These 8-bit addressable latches are designed for general purpose storage applications in digital systems. Specific uses include working registers, serial-holding registers, and active-high decoders or demultiplexers. They are multifunctional devices capable of storing single-line data in eight addressable latches, and being a 1-of-8 decoder or demultiplexer with active-high outputs.

Four distinct modes of operation are selectable by controlling the clear and enable inputs as enumerated in the function table. In the addressable-latch mode, data at the datain terminal is written into the addressed latch. The addressed latch will follow the data input with all unaddressed latches remaining in their previous states. In the memory mode, all latches remain in their previous states and are unaffected by the data or address inputs. To eliminate the possibility of entering erroneous data in the latches, the enable should be held HIGH (inactive) while the address lines are changing. In the 1-of-8 decoding or demultiplexing mode, the addressed output will follow the level of the D input with all other outputs LOW. In the clear mode, all outputs are LOW and unaffected by the address and data inputs.

## **Absolute Maximum Ratings**(Note 1)

Supply Voltage 7V Input Voltage 7V Operating Free Air Temperature Range  $0^{\circ}\text{C to } +70^{\circ}\text{C}$  Storage Temperature Range  $-65^{\circ}\text{C to } +150^{\circ}\text{C}$ 

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 2:** The symbols  $(\downarrow, \uparrow)$  indicate the edge of the clock pulse used for reference:  $\uparrow$  for rising edge,  $\downarrow$  for falling edge.

Note 4: The select-to-enable setup time is the time before the HIGH-to-LOW enable transition that the select must be stable so that the correct latch is selected and the others not affected.

Note 5:  $T_A = 25^{\circ}C$  and  $V_{CC} = 5V$ .
